UV

### Ultra Violet Standard Output (SO) Water Disinfection Systems

Model Number: UV24, UV57, UV80

#### Applications

Domestic UV water disinfection systems are a safe and effective means of eliminating harmful bacteria from drinking water supplies. They can also be used for small scale waste water disinfection at reduced flow rates.

- No chemicals
- No by-products
- No taste
- Impossible to overdose

#### FEATURES

- Now available with integral lamp life monitor, with both audible and visual indication of lamp life
- Axial flow, 304 stainless steel polished chambers
- Visual sight port for "lamp on" verification
- Designed & manufactured to ASME pressure vessel standards
- Flow rates stated at 95% UVT at a dose of 30mJ/cm<sup>2</sup>
- True gland seal retaining nut with positive stop
- User friendly bayonet style lamp connector (quick ¼ turn removal with no extra tools needed)
- Reliable, industry proven, proprietary low pressure (LP) coated UV lamps with ceramic bases for durability and long life (9000 hours)
- Constant current electronic controller (one controller for all systems) in a splash proof case, fully potted ballast virtually eliminates common water damage issue
- Audible & visual lamp failure indicators
- Tactile selector button

## Sunny Blue PVC Layflat medium duty water delivery hose

Working pressure up to 420kPa @ 20°C.  
Designed for general water delivery applications.  
Uses: Drip sub mains, Constructions and  
De-Watering. Available from 1 1/2" to 8"  
rolls or by the meter.

**MARCH ONLY SPECIAL  
4" X 100MT ROLL \$380.00\***

\*all prices include GST and are valid until March 31st, 2021

## FALL ARMYWORM and lawn grubs

The Fall Armyworm (*Spodoptera frugiperda*) has been detected in the Bundaberg region since April 2020, with corn and sorghum presenting as preferred hosts. Fall armyworm attack their hosts during all growth stages and the damage caused can be confused with that caused by *Helicoverpa* and common armyworm. As such, early detection is essential, with regular checks for insect presence and damage recommended. An integrated pest management strategy is key as well as the consideration of your cover cropping species selections. Part of Fall Armyworms' lifecycle is within the soil so consideration of cover cropping species is recommended to reduce the occurrence of persistent populations. APVMA has also released temporary chemical permits on a range of products for Fall Armyworm in numerous crops and situations.

For the home-gardeners and landscapers, check your lawn for signs of lawn grubs. Signs may include: moths around the lawns surface, wasps around the lawns surface that are preying on the grubs, high numbers of birds in the morning or late afternoon preying on the grubs and patches of browning lawn and a distinct sponginess when walked upon in some areas.

If you would like discuss options on pest management and cover crops please get in touch with your local Sunfam representative.
